## Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application.

## Listing of Claims:

- 1. (Currently amended) A CMOS active pixel sensor (APS) transducer array for sensing an image, the array having a number of APS's arranged in columns and rows and the array being adapted to decimate the image by accessing output signals only from selected APS's in the array, comprising:
  - a power terminal means adapted to be connected to a power supply;

    a ground terminal means adapted to be connected to ground;

    means a switching circuit adapted to for electrically connected terminal only the selected APS's between the power terminal means and the ground terminal
- (Currently amended) A transducer array as daimed in claim 1 wherein the connecting means switching circuit comprises:
- a switch means for connecting the selected APS's to the power terminal means; and

means for energizing the selected APS's for a complete image sensing cycle.

- coupling means coupler for connecting the APS's to the ground terminal means.
- (Original) A transducer array as claimed in claim 2 wherein the selected APS's are located in an array column.
- (Original) A transducer array as claimed in claim 2 wherein the selected APS's are located in an array row.
- (Original) A transducer array as claimed in claim 2 wherein the selected APS's are located in columns and rows of the array.
- (Original) A transducer array as claimed in claim 2 wherein the selected APS's comprise all of the APS's located in selected array columns.
- (Original) A transducer array as claimed in claim 2 wherein the selected APS's comprise all of the APS's located in selected array rows.
- 8. (Currently amended) A transducer array as claimed in claim 1 wherein the connecting

meansswitching circuit comprises:

a switch means for connecting the selected APS's to the ground terminal means; and coupling means coupler for connecting the APS's to the power terminal

means.

- (Original) A transducer array as claimed in claim 8 wherein the selected APS's are located in an array column.
- (Original) A transducer array as claimed in claim 8 wherein the selected APS's are located in an array row.
- (Original) A transducer array as claimed in claim 8 wherein the selected APS's are located in columns and rows of the array.
- (Original) A transducer array as claimed in claim 8 wherein the selected APS's comprise all of the APS's in selected array columns.
- (Original) A transducer array as claimed in claim 8 wherein the selected APS's comprise all of the APS's located in selected array rows.
- 14. (Currently amended) A CMOS active pixel sensor (APS) transducer array for sensing an image, the array having a number of APS's arranged in N columns and M rows and the array being adapted to decimate the image by accessing output signals only from selected APS's comprising:

a power terminal adapted to be connected to a power supply; a ground terminal adapted to be connected to a ground;

means for coupling a switching circuit adapted to selectively connect the APS's between the power terminal and the ground terminal, wherein the selected APS's are energized for a complete image sensing cycle, comprising:

- N transistor means-switches wherein each of the N transistor means-switches is connected between APS's in a respective column and the power terminal; and
- further coupling means a coupler for coupling connecting the APS's in the respective columns to the ground terminal.
- 15. (Currently amended) A transducer array as claimed in claim 14 wherein the further coupling means coupler comprises M transistor means switches, wherein each of the M transistor means-switches is connected between APS's in a respective row and the ground terminal.

- 16. (Currently amended) A transducer array as claimed in claim 15 comprising a controllercentrel means coupled to the N and M transistor means switches for selectively activating and or deactivating the N and M transistor means switches for the complete image sensing cycle.
- 17. (Currently amended) A CMOS active pixel sensor (APS) transducer array for sensing an image, the array having a number of APS's arranged in N columns and M rows and the array being adapted to decimate the image by accessing output signals only from selected APS's comprising:
- a power terminal adapted to be connected to a power supply;
- a ground terminal adapted to be connected to a ground;
- means for coupling-a switching circuit adapted to selectively connect the APS's between the power terminal and the ground terminal, wherein the selected APS's are energized for a complete image sensing cycle, comprising:
  - N transistor means-switches wherein each of the N transistor means-switches is connected between APS's in a respective column and the ground terminal; and
  - further soupling means for coupling a coupler for connecting the APS's in the respective columns to the power terminal.
  - 18. (Currently amended) A transducer array as claimed in claim 17 wherein the further eoupling means coupler comprises M transistor means switches, wherein each of the M transistor means switches is connected between APS's in a respective row and the power terminal.
  - 19. (Currently amended) A transducer array as claimed in claim 18 comprising a controller centrol-means coupled to the N and M transistor means switches for selectively activating and or deactivating the N and M transistor means switches for the complete Image sensing cycle.
  - 20. (Currently amended) A CMOS active plxel sensor (APS) transducer array for sensing an image, the array having a number of APS's arranged in N columns and M rows and the array being adapted to decimate the image by accessing output signals only from selected APS's comprising:
- a power terminal adapted to be connected to a power supply;
- a ground terminal adapted to be connected to a ground;
- means for coupling a switching circuit adapted to selectively connect the APS's between
  the power terminal and the ground terminal, wherein the selected APS's are energized for
  a complete sensing cycle, comprising:
  - M transistor means-switches wherein each of the M transistor means-switches is connected between APS's in a respective row and the power terminal; and

- further-coupling-means for-couplings coupler for connecting the APS's in the respective row to the ground terminal.
- 21. (Currently amended) A transducer array as claimed in claim 20 comprising control means a controller coupled to the M transistor means switches for selectively activating and or deactivating the M transistor means switches for the complete image sensing cycle.
- 22. (Currently amended) A CMOS active pixel sensor (APS) transducer array for sensing an image, the array having a number of APS's arranged in N columns and M rows and the array being adapted to decimate the image by accessing output signals only from selected APS's comprising:
- a power terminal adapted to be connected to a power supply;
- a ground terminal adapted to be connected to a ground;
- means for soupling a switching circuit adapted to selectively connect the APS's between
  the power terminal and the ground terminal, wherein the selected AP'S are energized
  during a complete image sensing cycle, comprising:
  - M transistor means switches, wherein each of the M transistor means switches is connected between APS's in a respective row and the ground terminal; and
  - further coupling means a coupler for connecting for coupling the APS's in the respective row to the ground terminal.
- 23. (Currently amended) A transducer array as claimed in claim 22 comprising central means a controller coupled to the M transistor means switches for selectively activating and or deactivating the M transistor means switches for the complete image sensing cycle.
- 24. (Currently amended) In a CMOS active pixel sensor (APS) transducer array having a number of APS's arranged in columns and rows and adapted to be connected to a power supply, for providing output signals representing an image and wherein the outputs of selected APS's are not-accessed to decimate the image thereby reducing the output bandwidth of the transducer array, a method of controlling power consumption in the array comprising the steps of:
  - a. determining the selected APS's having outputs that are to benet accessed;
  - b. connecting the selected APS's to the power supply for a complete image sensing cycle: and
  - <u>b.c.</u> disconnecting the selected APS's <u>that are not selected</u> from the power supply <u>for the complete image sensing cycle</u>.
- 25. (Original) The method as claimed in claim 24 wherein the selected APS's are located in predetermined columns.
- 26. (Original) The method as claimed in claim 25 wherein the selected APS's are located in predetermined rows.

- 27. (Original) The method as claimed in claim 24 wherein the selected APS's are located in every second, second to fourth or second to eighth columns.
- 28. (Original) The method as claimed in claim 24 wherein the selected APS's include all of the APS's located in predetermined columns.
  - 29. (Original) The method as claimed in claim 28 wherein the selected APS's include all of the APS's located in predetermined rows.
  - 30. (Original) The method as claimed in claim 24 wherein the selected APS's include all of the APS's located in predetermined rows.
